The CPIS

Like a smaller, personalized Wikipedia, for your computer! The computer parts information site is a website that helps its users know what all the different parts to a pc do.

For many years, I had a PC and didn't know what the parts inside of it did, just that it worked. I hope to solve that problem with the computer parts information site, by teaching about all the individual components of a standard PC. On the site, the user can simply click on images of the parts of the PC they want to know more about, and a page will be displayed showing information on how it works and what it does. The explanations won't be too technical, so anyone wanting to learn can understand.

Personas:

- Younger students getting into PC building
- Older, less tech savvy, trying to learn about computers
- People shopping for PC parts

Comparative websites:

- Youtube/Google (just looking it up)
- Amazon
- UserBenchmark
